

Ferns N Petals — Sales Analysis

Executive Summary | FY2023 Order Data | Excel-Based Analytics & Dashboard Project

1. Purpose & Scope

This project analyzes a full year (2023) of order-level transaction data from Ferns N Petals, a gifting, flowers, and plants retailer, to quantify sales performance and surface actionable insights on revenue drivers, customer behavior, delivery performance, and product mix. The underlying data was extracted, cleaned, modeled, and visualized entirely in Microsoft Excel, resulting in a single interactive dashboard that business stakeholders can filter and explore without needing to touch the raw data.

The analysis covers three linked data domains — **Customers** (100 records), **Products** (70 SKUs across 7 categories), and **Orders** (1,000 transactions) — joined through **Customer_ID** and **Product_ID** keys into a single analytical model.

2. Headline Metrics

1,000 Total Orders	Rs. 35,20,984 Total Revenue	100 Total Customers	5.53 days Avg. Delivery Time
------------------------------	---------------------------------------	-------------------------------	--

Average order value works out to roughly **Rs. 3,521** per order across the year. The 100-customer base placed an average of 10 orders each, indicating a repeat-purchase-heavy customer pool rather than a predominantly one-time-buyer base.

3. Revenue Trends

Revenue is highly seasonal. **March was the strongest month (Rs. 7,16,555)**, roughly 4.6x January, the weakest month (Rs. 1,02,673). A second, smaller peak occurs around August-September, likely tied to festival and gifting occasions. Revenue by hour of day is comparatively flat with mild peaks in the evening hours, suggesting order timing is not a major lever for revenue concentration compared to seasonality.

Month	Revenue (Rs.)	Month	Revenue (Rs.)
March	7,16,555	September	3,93,526
February	4,89,619	June	1,74,606
August	4,77,485	December	1,59,938
November	4,36,823	January	1,02,673

4. Customer & Gender Insights

Revenue is nearly evenly split by gender, with **male customers contributing Rs. 17,90,223 (50.9%)** and **female customers contributing Rs. 17,30,761 (49.1%)** — indicating the customer base is gender-balanced and marketing/product strategy need not over-index on one segment. The top 5 customers by revenue (led by Samaira Ganesh, Divit Mahajan, and Ranbir Loyal) each generated well above the average per-customer revenue, pointing to a small high-value customer segment worth targeted retention efforts.

5. Geographic Distribution

Orders are spread thinly but broadly across cities rather than concentrated in a few metros. The top 10 cities by order count (Bareilly, Ghaziabad, Bhilai, Satara, Ozhukarai, Sirsa, Tirunelveli, Muzaffarnagar, Alwar, and Lucknow) each account for only 7-9 orders out of 1,000, meaning no single city dominates demand. This suggests a genuinely pan-India order base rather than a metro-led one, with logistics/delivery planning needing to account for wide dispersion rather than hub concentration.

6. Product & Occasion Performance

By category, **"Colors" is the leading revenue contributor (Rs. 10,05,645)**, well ahead of Soft Toys (Rs. 7,40,831) and Sweets (Rs. 7,33,842), while Cake and Mugs trail as smaller categories. By occasion, **Anniversary (Rs. 6,74,634)** and **Raksha Bandhan (Rs. 6,31,585)** are the top two revenue-generating occasions, followed closely by the "All Occasions" bucket and Holi — reinforcing that festival- and relationship-linked gifting moments are the primary revenue engine, not everyday/non-occasion purchases.

Category	Revenue (Rs.)	Occasion	Revenue (Rs.)
Colors	10,05,645	Anniversary	6,74,634
Soft Toys	7,40,831	Raksha Bandhan	6,31,585
Sweets	7,33,842	All Occasions	5,86,176
Cake	3,29,862	Holi	5,74,682

The Top 5 products by revenue — Magnam Set, Quia Gift, Dolores Gift, Harum Pack, and Deserunt Box — are all bundled gift-set style products rather than single-item purchases, suggesting bundling is an effective revenue strategy worth expanding.

7. Delivery Performance

The average time between order placement and delivery across all 1,000 orders is **5.53 days**. Combined with the calculated per-order delivery-day field in the cleaned dataset, this metric can be sliced further by city or product category in the dashboard to identify specific regions or SKUs with slower fulfillment, which is a natural next step for operational improvement.

8. Methodology

The project followed a standard three-stage Excel analytics workflow:

- **Raw Data (Raw_Data_Set.xlsx):** Original, unprocessed extracts across Customers, Products, and Orders sheets.
- **Data Cleaning & Modeling (Cleaned_Data_Set.xlsx):** Standardized data types, removed empty sheets, and enriched the Orders table with calculated fields — Month Name, Order Day, Order/Delivery time breakdowns, Diff_Order_Delivery (delivery lead time), joined Price (INR), and Revenue (Quantity x Price).
- **Dashboard Build (Dashboard.xlsx):** PivotTables built on the cleaned model, visualized as PivotCharts (line, bar, donut) on a single Dashboard sheet, with Order_Date, Gender, and City slicers enabling interactive, cross-filtered exploration.

9. Key Takeaways & Recommendations

- Plan inventory and staffing around the March and August-September demand peaks; build a specific playbook for the January trough.
- Double down on gift-set/bundle products (the current Top 5 revenue drivers) rather than single-item SKUs.
- Prioritize Anniversary and Raksha Bandhan campaign investment given they are the two highest-revenue occasions.
- Design logistics for a dispersed, pan-India customer base rather than a metro-concentrated one, since no city exceeds 1% of total orders.

- Investigate delivery-time variance by city/category to bring outlier regions closer to the 5.53-day average.
- Consider a loyalty/retention program for the small set of high-value repeat customers identified in the Top Customers view.
